

# Statistical Analysis of CFD Solutions from the 3rd AIAA Drag Prediction Workshop

J. H. Morrison

Computational AeroSciences Branch

M. J. Hemsch

Configuration Aerodynamics Branch

NASA Langley Research Center

3<sup>rd</sup> AIAA APA Drag Prediction Workshop

June 3-4, 2006

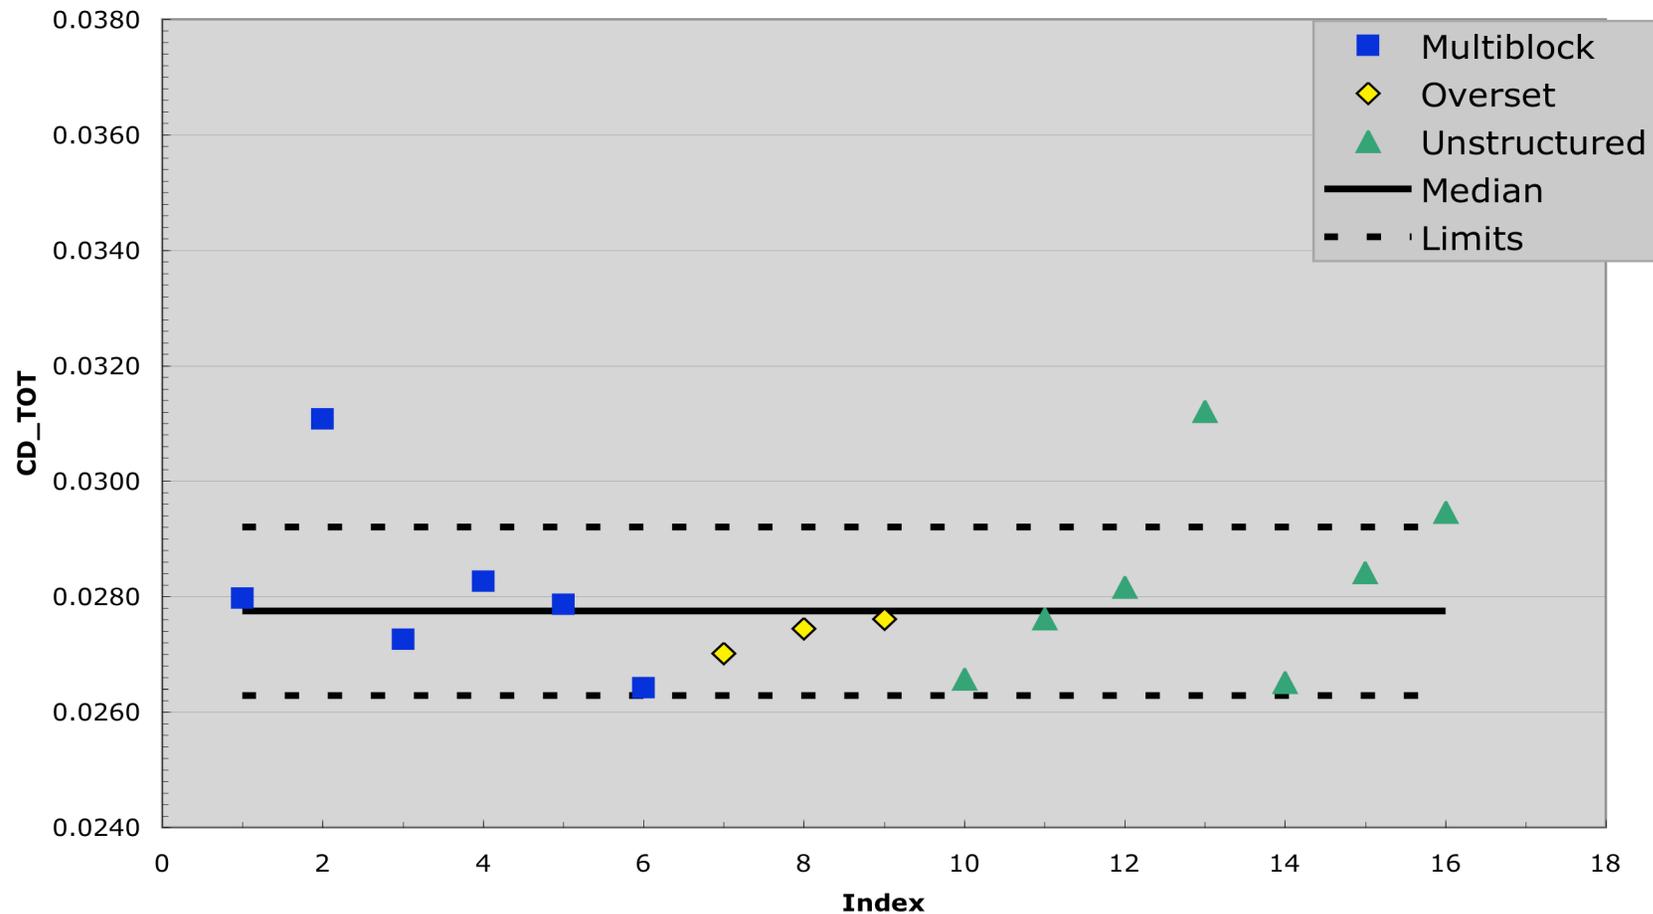

- Method for analyzing the collective
- Case 1 DLR-F6 and FX2B Fairing
  - Individual Solution Analysis
  - Grid Convergence Study
  - Comparison with DPW-2
- Case 2 Grid Convergence Study for DPW-W1
- Summary
- Concluding Remarks

- Grid Convergence for nested solutions
  - Reduction in spread?
  - Reduction in scatter of “core” solutions?
  - Significant changes in medians?
  - Compare DPW-2 and DPW-3 spread and scatter

## CD\_TOT F6 Fine Grid

The median gives a robust estimate of the population mean.

Different Turbulence Models**

**Same Grid Nodes; Different Cells  
Same Turbulence Model  
Different Code**

# What does convergence look like? DPW-3

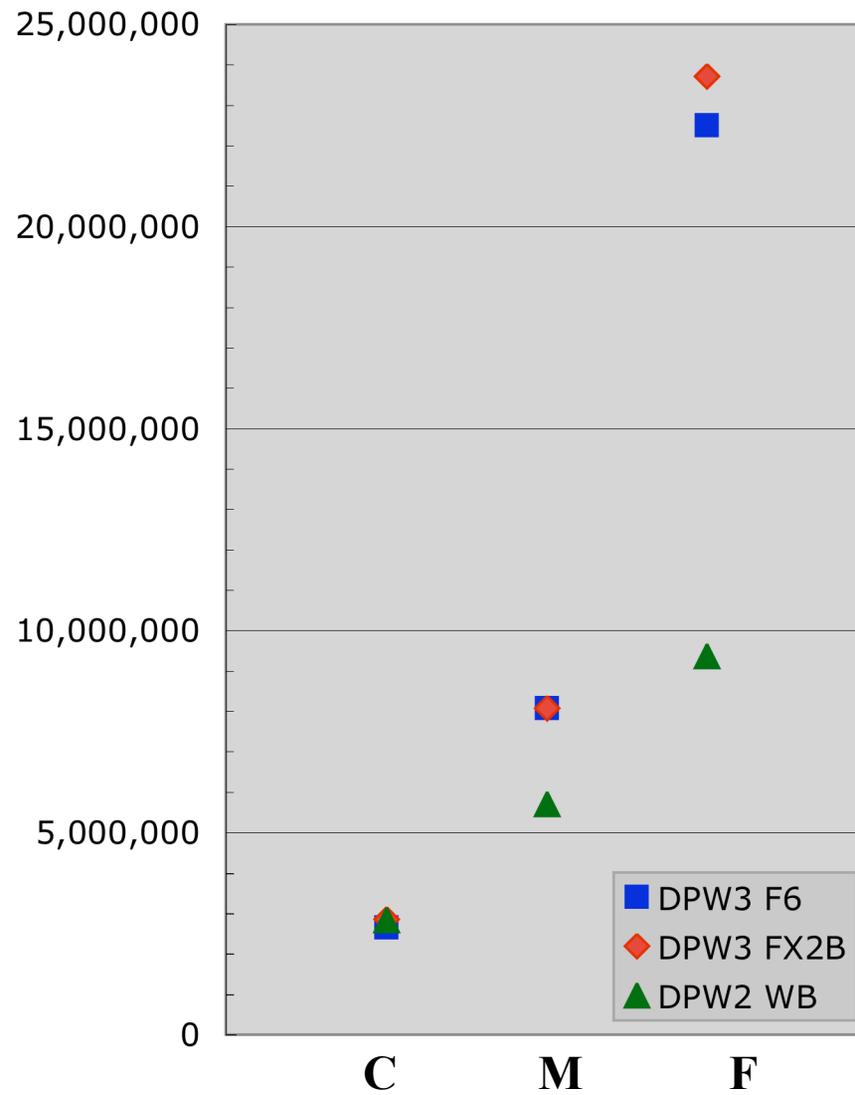

---

- **Scatter in solutions is due to:**
  - Numerical error
  - Modeling error (e.g. physics models, computational models)
  - User errors
  - Code errors
- **For grid convergence, numerical error asymptotically approaches zero leaving the other three contributors**
- **For the collective to show convergence, the following would have to happen:**
  - The ranges for the configurations would approach a constant as the grid “improved”.
  - The scatter (standard deviation) of the “core” solutions would approach a constant as the grid improved.
  - The medians of the core solutions would change asymptotically.

# Summary

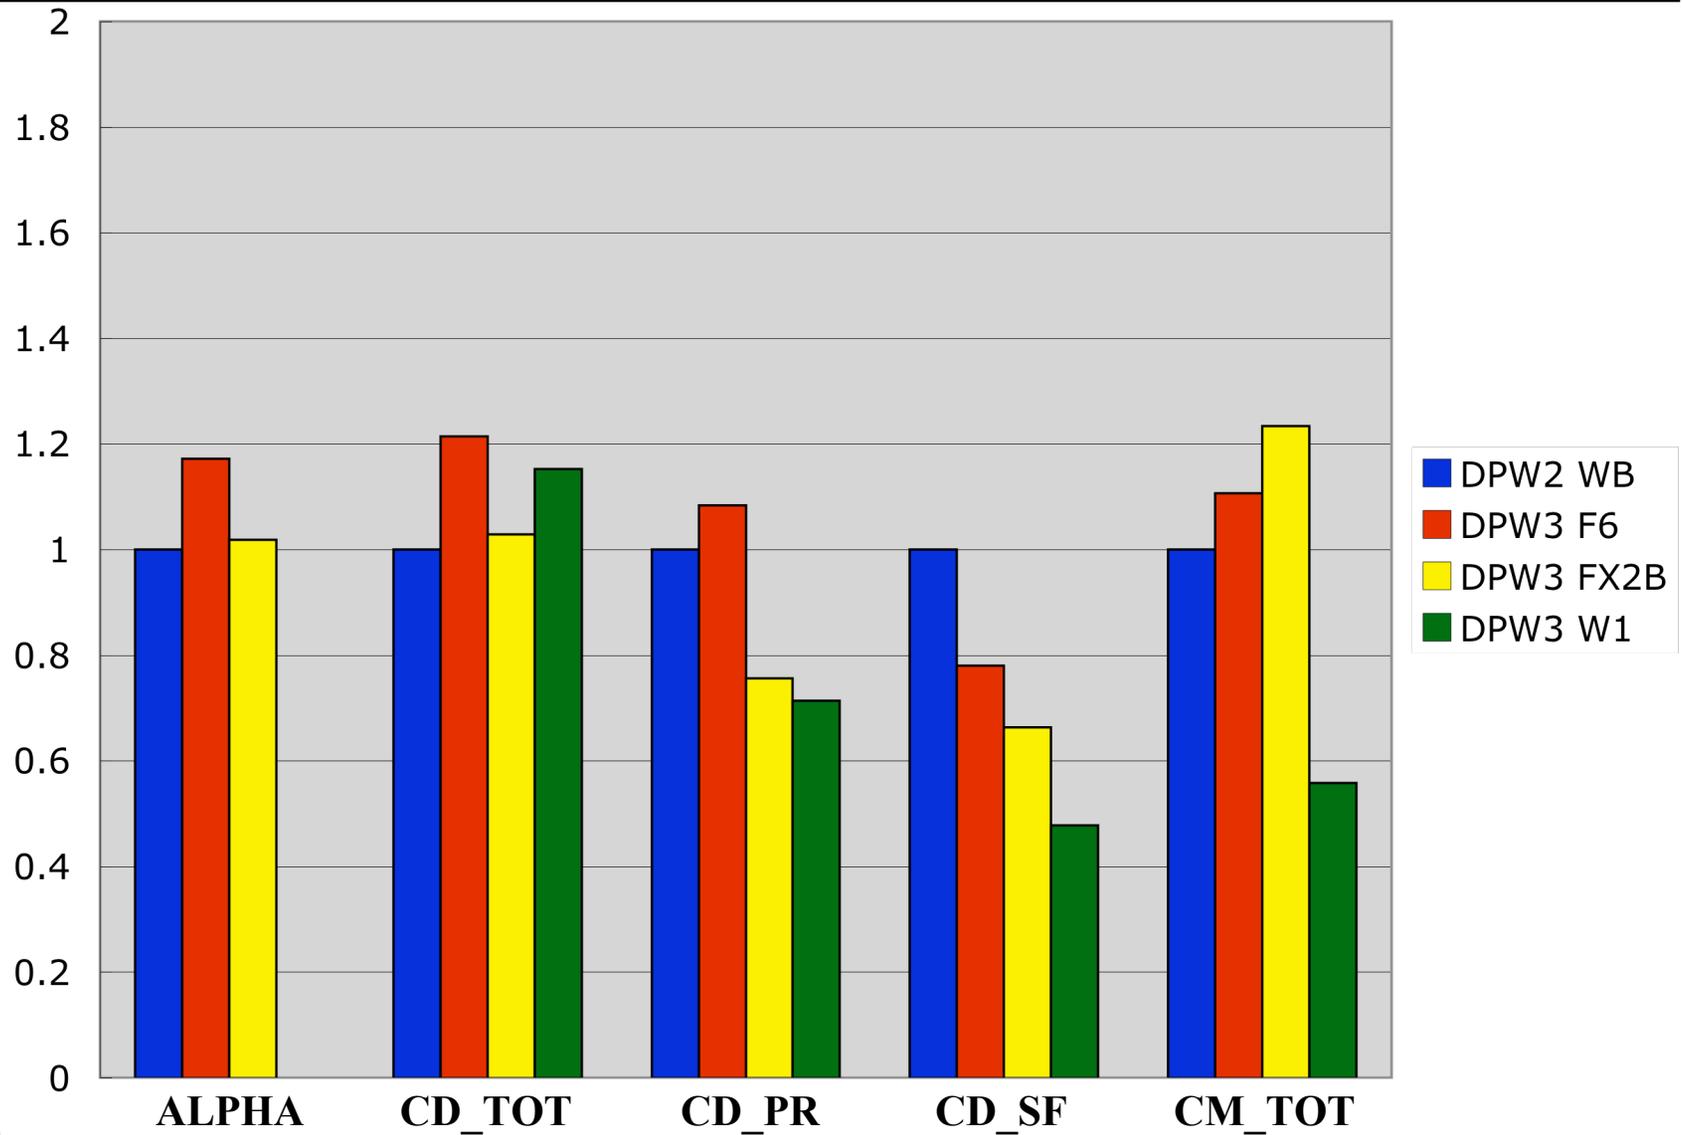

# Spread (of nested data) for Finest Grid DPW-3

# Core Interval for Finest Grid

# DPW-3

- The Good News:
  - DPW-3 was a “blind test”, i.e. no experimental data existed to “guide” solutions. The results were about as good for the blind test as for DPW-2.
  - DPW-W1 might be showing evidence that it is in the asymptotic range
- The Less Good News:
  - Have not demonstrated convergence of medians, spread or core interval for F6/FX2B despite increased grid sizes
  - F6 spread and core interval have not improved from DPW-2
  - FX2B spread and core interval are not substantially better than F6
  - DPW-W1 spread and core interval are not showing convergence
  - After 3 drag prediction workshops, grids remain a leading order issue

Hemsch's remarks from DPW-2 still apply:

- Regarding grid convergence for the collective:
  - **There is no reduction in spread;**
  - **There is no reduction in core scatter;**
  - **The medians MAY be converging, although it can't be proven with the present results.**

- 
- We must make a concerted effort to understand the differences in the codes and models
  - We must make a concerted effort to understand the effects of grid quality and grid resolution
  - We must analyze and improve our processes

**Fini?**

## Grid Convergence – All Solutions
